- Dessler (1967)

17th AAS Meeting in Seattle, Washington, 28 – 30 June 1971

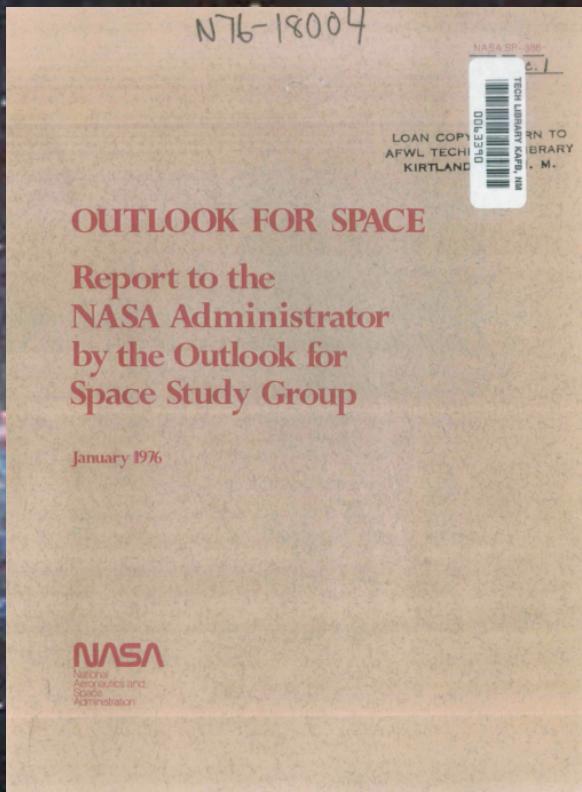

Scientific and technical bases
for solar system escape
missions were discussed

The forthcoming flights of Pioneers F and G will see the launch from earth of the first spacecraft to leave the solar system. In this paper, we describe the solar wind and how it forms a region of interplanetary space called the heliosphere. **There is little known about how (or even where) the solar wind interacts with the local interstellar medium. Our understanding of the plasma/magnetic-field interaction between the solar wind and interstellar medium will be placed on a definitive basis by information obtained by the spacecraft that obtain data from penetration of the interaction region.**

Science Formulation – mid 1970s

- By 1976 A “modest” proposal had been incorporated in the massive NASA *Outlook for Space* report

The 1976 – 1977 JPL effort had a significant science driver

ICARUS 39, 486–494 (1979)

Science Aspects of a Mission Beyond the Planets

LEONARD D. JAFFE AND CHARLES V. IVIE

Jet Propulsion Laboratory, California Institute of Technology, 4800 Oak Grove Drive, Pasadena, California 91103

Received July 26, 1978; revised April 10, 1979

A mission out of the planetary system, launched about the year 2000, could provide valuable data concerning characteristics of the heliopause, the interstellar medium, stellar distances (by parallax measurements), low-energy cosmic rays, interplanetary gas distribution, and mass of the solar system. Secondary objectives include investigation of Pluto. Candidate science measurements, instruments, and instrument development needs are discussed. The mission should extend from 400 to 1000 AU from the Sun. A heliocentric hyperbolic escape velocity of 50–100 km/sec or more is needed to attain this distance within a reasonable mission duration (20–50 years). The trajectory should be toward the incoming interstellar gas. For a year 2000 launch, a Pluto encounter and orbiter can be included. A second mission targeted parallel to the solar axis would also be worthwhile.

An Interstellar Probe Has Been Advocated by the Science Community for Over 35 Years

Keck Institute of Space Studies (KISS), Caltech: Workshops

- The Science and Enabling Technologies for the Exploration of the Interstellar Medium (ISM), Edward C. Stone, Leon Alkalai, Lou Friedman.
- Two workshops held: September 2014, January 2015
- ~ 32 participants
- Final Report, July 2015

3 Study Leads: Caltech/JPL/TPS

1 Great Study Team

Goals of the KISS Workshops

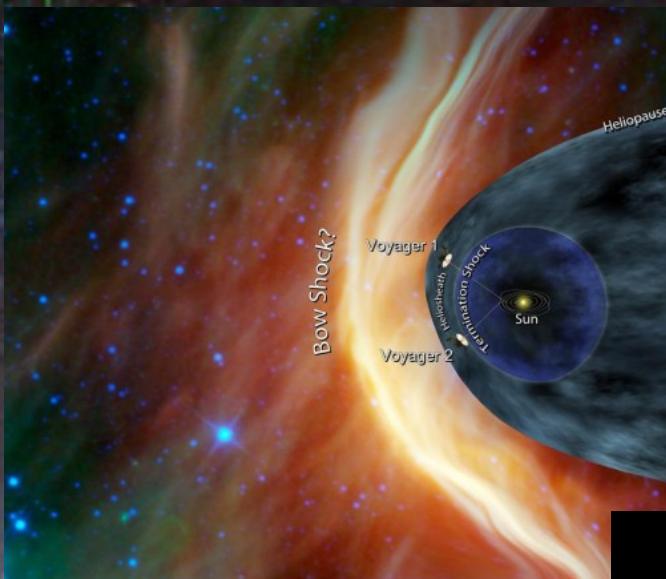

Capability Push:

- Can we reach the ISM in 10-15 years, rather than 36 (Voyager 1/2)?
- Can we achieve solar-system escape velocity of > 12 AU/Yr. and venture deep into the ISM, as a first step towards reaching to another star?
 - Voyager 1 ~3.6 AU/Yr.; Voyager 2 ~3.1 AU/Yr.; New Horizons ~ 2.75 AU/Yr.
- Can we build a low power, autonomous robotic systems to survive > 50 years?

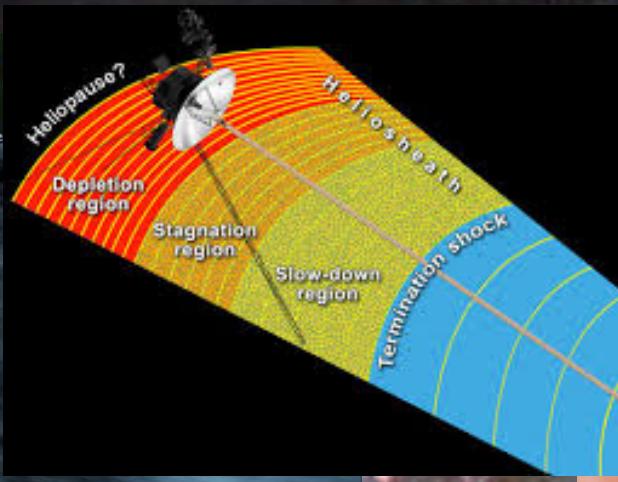

Science Pull:

- Compelling science goals in exploring the ISM: 100 – 300 AU
- Compelling science to be done on the way to the ISM.
- Visiting a large KBO

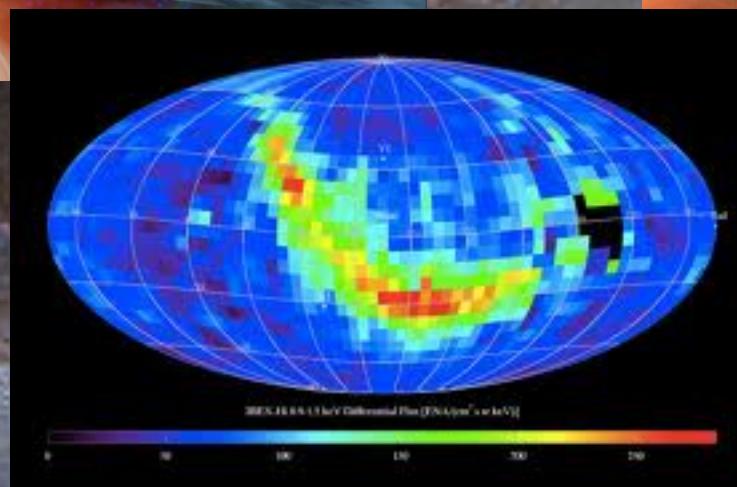

The Heliosphere – and Questions – Now

Voyager 1 entering interstellar space?
Differences at Voyager 2
Is there an external bow shock?

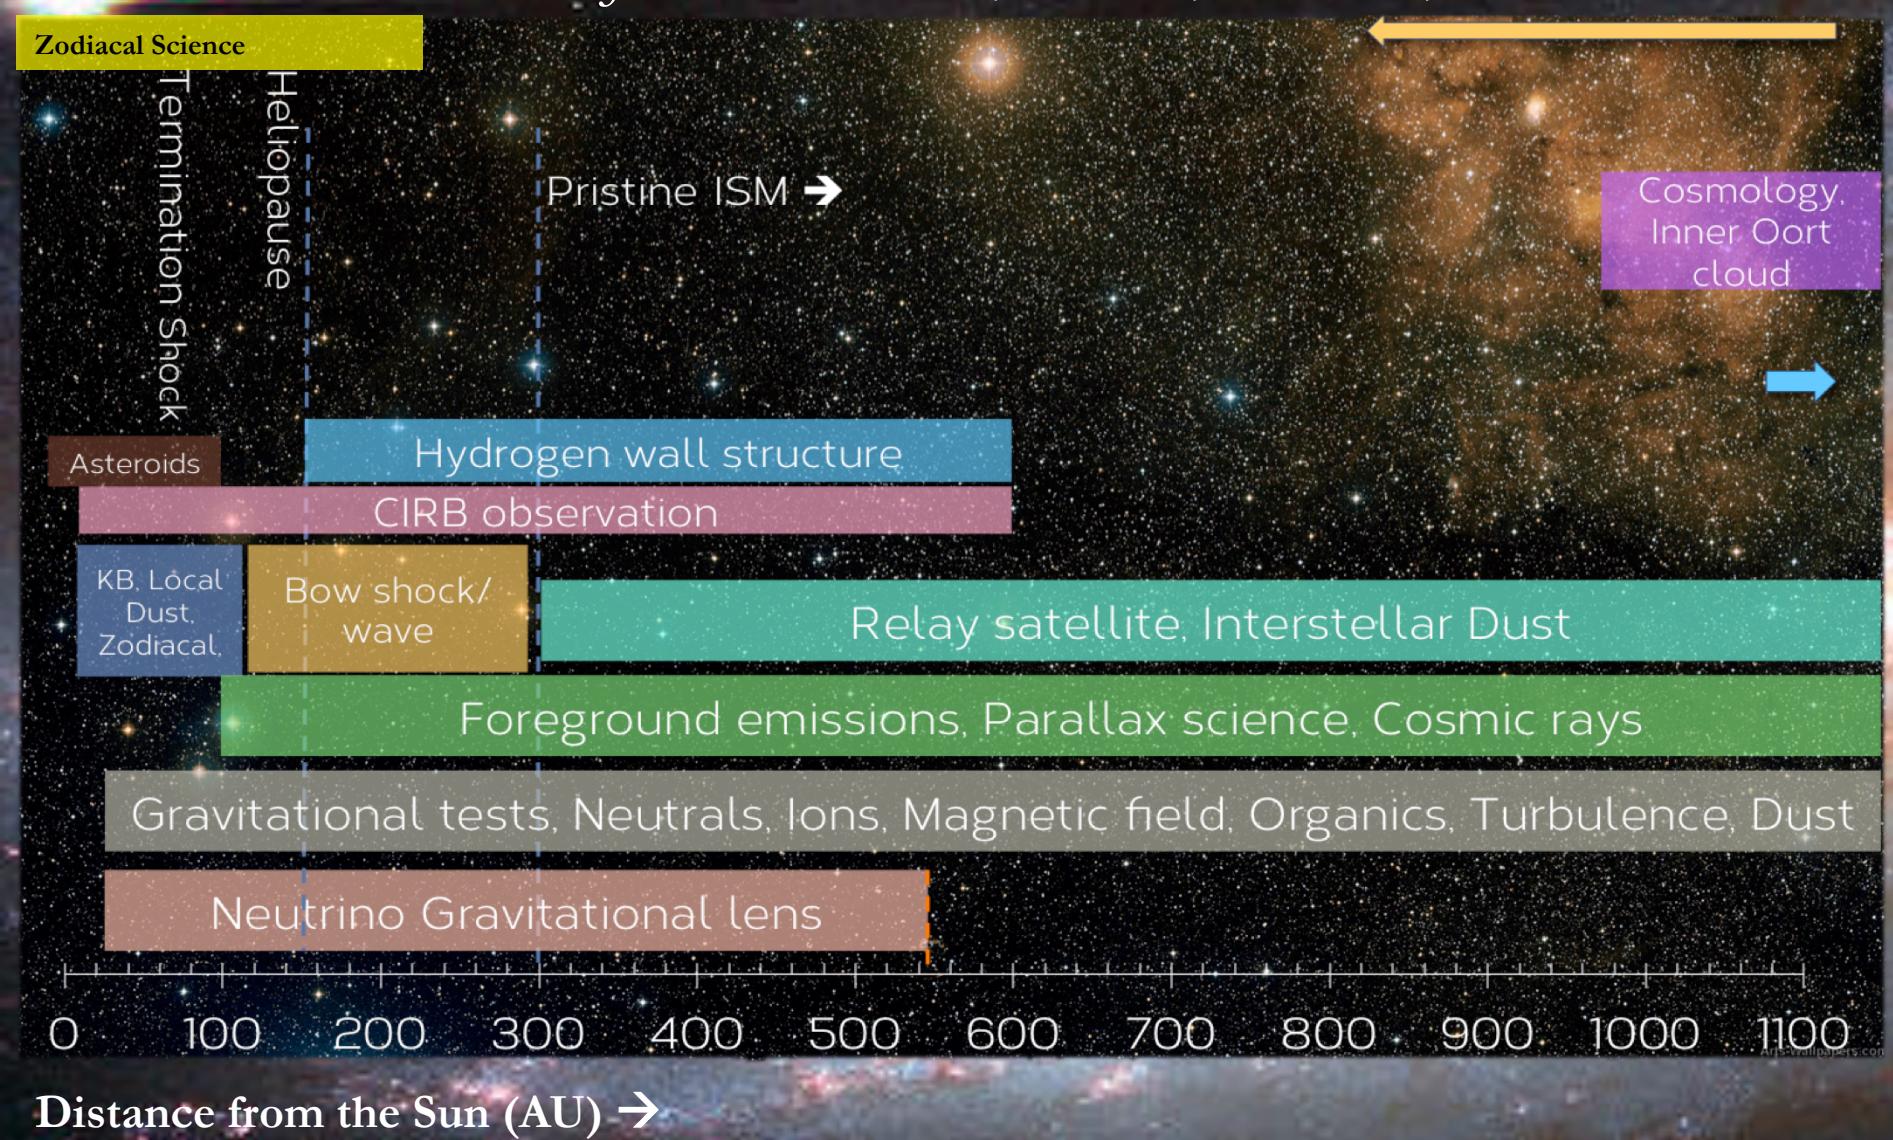

Astrosphere of LL Orionis
(Hubble Space Telescope)

The IBEX ribbon of energetic neutral atoms (ENAs)

Also seen by Cassini

Key Result of 2 KISS Workshops: “There is compelling science on the way to the ISM, at the ISM, and from the ISM”, Stone, Alkalai, Friedman

Key Heliophysics Science Questions

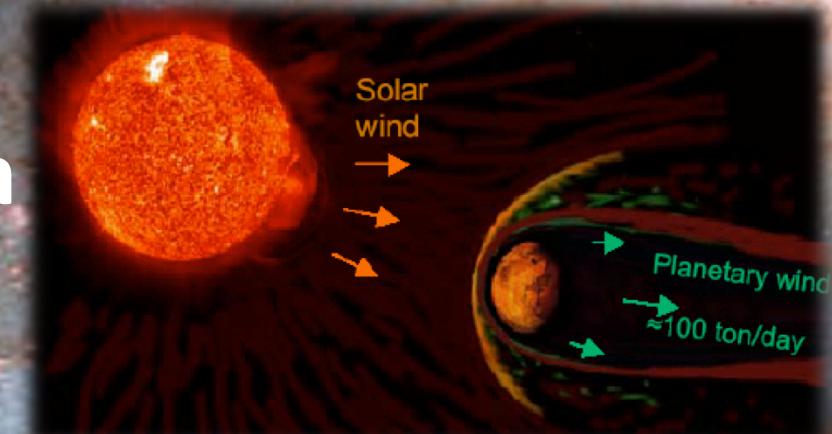

- What are the characteristics of the termination shock, the heliopause and the region in between?
- What is the influence of the interplanetary magnetic field on these structures?
- What are the transport and acceleration processes in these regions?
- How does the distribution functions of the ions and neutrals evolve along the trajectory of the spacecraft?
- Does the solar cycle influence the dynamics of these structures?
- How does the heliosheath shield against cosmic rays and neutral particles?
- and what role does it play in the interstellar-terrestrial relations?

Key Astrophysics Science Questions

- What is the nature of the Zodiacal background?
- What is the physical state of the interstellar medium, its composition and its magnetic field?
- What is the undisturbed interstellar spectrum of galactic cosmic rays?
- What can we learn from the composition and dynamics of interstellar dust grains?

Science on the way to the ISM and within our solar system

- Zodiacal/Cosmic background science
- Solar-wind Science
- Parallax science, radio Science & astrometry
- Science close to the Sun

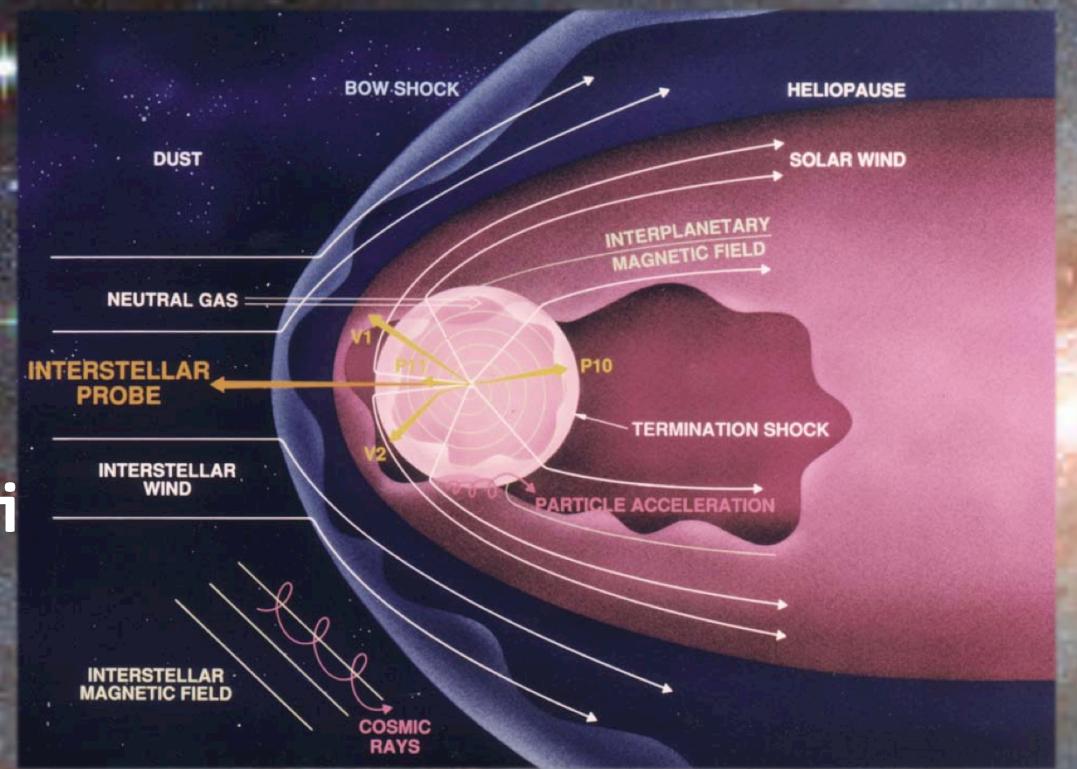

Science of the Local ISM (> 50 AU)

- Termination shock
- Heliopause
- Hydrogen Wall
- Bow-shock
- Bow-wave
- Organics
- Dust composition

Science of the Pristine ISM (>200 AU)

- Interstellar magnetic field: direction, strength and turbulence
- Cosmic-ray science
- Interstellar winds
- Primordial Blackholes
- WIMS (weakly-interacting massive particles)
- Organics
- Dust composition of the Pristine ISM

<http://interstellar.jpl.nasa.gov/>

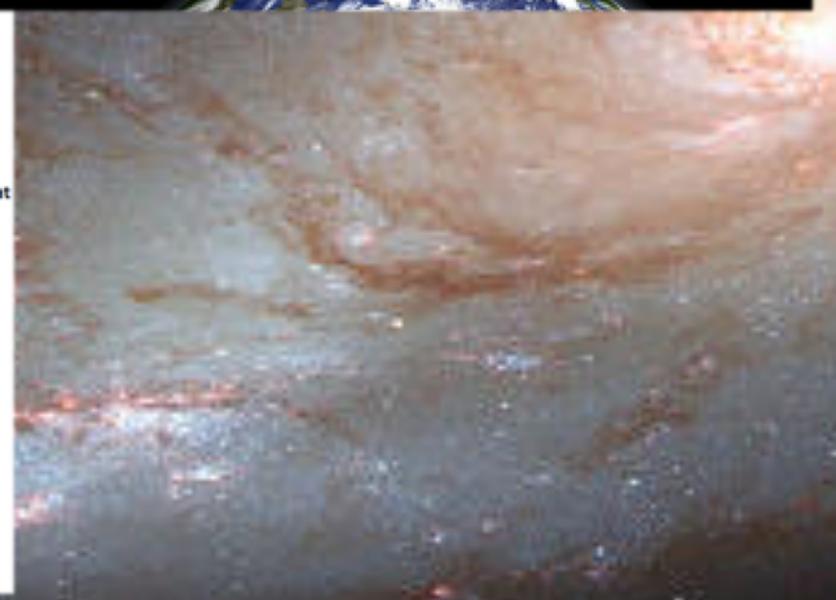

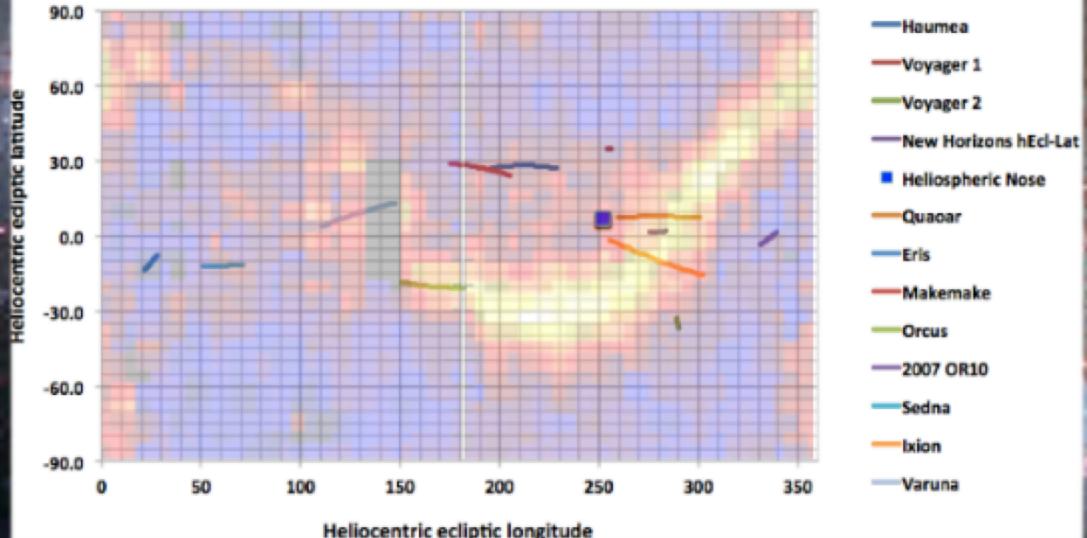

KBO Science (~ 30-50 AU)

KBO science with very fast flyby

- Flyby speed > 60 km/s
- Cubesat impactor ??

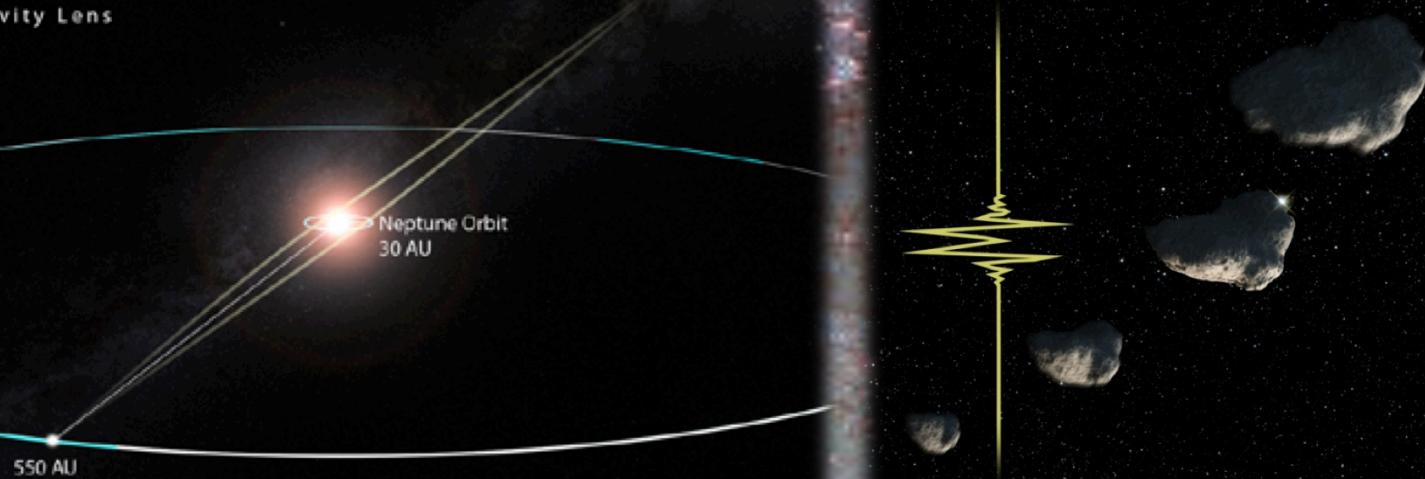

Large Kuiper Belt Object locations: 2010 - 2040

Science from the ISM (>50 AU)

- Radio Science
- Solar gravity lens focus (550 AU and beyond)
- Exoplanets and KBO detection

FOCAL
Solar Gravity Lens

Taking a first step towards
another star:

*Explore the local environment
first!*

Science Goals

From ISP STDT 1999:

1. Explore the nature of the interstellar medium and its implications for the origin and evolution of matter in our Galaxy and the Universe;
2. Explore the influence of the interstellar medium on the solar system, its dynamics, and its evolution;
3. Explore the impact of the solar system on the interstellar medium as an example of the interaction of a stellar system with its environment;
4. Explore the outer solar system in search of clues to its origin, and to the nature of other planetary systems.

Shortened version (McNutt):

1. What is the nature of the nearby interstellar medium?
2. How do the Sun and galaxy affect the dynamics of the heliosphere?
3. What is the structure of the heliosphere?
4. How did matter in the solar system and interstellar medium originate and evolve?

Interstellar Probe Instrument Payload

Science Questions	Interstellar Probe Science Objectives	Objective Questions	Science Measurement Objectives	Required Instruments	Analysis Product	Science Result
3rd Interstellar Probe Science and Technology Definition Team Mtg, 17-19 May 1999, JPL	From NASA's Interstellar Probe Science and Technology Definition Team Report		THIS WORK	THIS WORK	THIS WORK	
What is the nature of the nearby interstellar medium?	Explore the interstellar medium and determine directly the properties of the interstellar gas, the interstellar magnetic field, low-energy cosmic rays, and interstellar dust	How does the composition of interstellar matter differ from that of the solar system?	Elemental and isotopic abundances of significant species	PLS, EPS, CRS	Interstellar medium composition	Composition differential between the solar system and current local interstellar medium
		What constraints do the interstellar abundances of ^3H and ^3He place on Big Bang and chemical evolution theories?	^2H , ^3He , and ^4He abundances in the interstellar medium	CRS - LoZCR		
		Is there evidence for recent nucleosynthesis in the interstellar medium?	Isotopic abundances of "light" elements	CRS		
		What is the density, temperature, and ionization state of the interstellar gas, and the strength and direction of the interstellar magnetic field?	Bulk plasma properties, composition, and ionization state and vector magnetic field in the interstellar medium	MAG, PLS	Thermodynamic and physical state of the very local interstellar medium (VLISM)	Physical state of the VLISM
		What processes control the ionization state, heating, and dynamics of the interstellar medium?	Charge state, electron properties, Ly-a flux, neutral component properties	PLS, LAD, NAI, ENA	Energy inputs in the VLISM	
		How much interstellar matter is in the form of dust and where did it originate?	Dust flux, composition, pickup ion composition (from sputtering)	CDS, (PWS), PLS	Neutral matter assay for the VLISM	
		How much greater are cosmic ray nuclei and electron intensities outside the heliosphere, and what is their relation to galactic gamma ray and radio emission?	Cosmic ray ion and electron energy spectra; low frequency radio emissions	CRS, PWS	Low-energy galactic cosmic rays	
		What spectrum of 10-100 micron galactic infrared and Cosmic Infrared Background Radiation is hidden by emission from the zodiacal dust?	Infrared spectral measurements from 10 to 100 microns	Not measured	IR absorption by solar system dust	
		What is the size and structure of the heliosphere?	Detect heliospheric boundaries from their plasma, field, and radio signatures	MAG, PWS, PLS, EPS, LAD, ENA	Heliospheric spatial scales	Structure and dynamics of the heliosphere in the upwind direction
		How do the termination shock and heliopause respond to solar variations and interstellar pressure?	<i>In situ</i> plasma and field measurements on the time scale of a fraction of a solar rotation (~days)	MAG, PLS	Heliospheric temporal variability	
How do the Sun and galaxy affect the dynamics of the heliosphere?	Explore the influence of the interstellar medium on the Solar System, its dynamics, and its evolution	How does the interstellar medium affect the inner heliosphere and solar wind dynamics?	Pickup ions and anomalous cosmic rays, high energy electrons within the heliosphere	PLS, EPS, CRS	Spatial and temporal variability of the interstellar medium properties	Effects of the VLISM on the heliosphere
		What roles do thermal plasma, pickup ions, waves, and anomalous cosmic rays play in determining the structure of the termination shock?	Thermal plasma, pickup ions, wave, and anomalous cosmic rays properties on the scale of the scale of c/v_{w}	PLS, EPS, PWS, CRS - AGCR	Inputs from heliospheric interaction into the solar wind	
		What are the properties of interstellar gas and dust that penetrate into the heliosphere?	Thermodynamic properties and composition of neutral gas; dust flux and composition	NAI, ENA, CDS	Properties of interstellar gas and dust in the outer heliosphere	
What is the structure of the heliosphere?	Explore the impact of the solar system on the interstellar medium as an example of the interaction of a stellar system with its environment	Does the heliosphere create a bow shock in the interstellar medium?	Plasma and magnetic field measurements at ion-inertial scale length from the heliosheath into the interstellar medium (telemeter changes)	MAG, PWS, PLS	Determination of whether the solar system produces an external shock	Impact of the solar system on the local composition and thermodynamic properties of the VLISM
		What is the relation of the hydrogen wall outside the heliopause to similar structures and winds observed in neighboring systems?	Neutral atom and plasma ion distribution functions from the heliopause through the heliosheath	NAI, ENA, PLS	Structure and properties of the predicted hydrogen wall	
		How do the Sun and heliosphere influence the temperature, ionization state, and energetic particle environment of the local interstellar medium? How far does the influence extend?	Particle properties from thermal plasma to galactic cosmic rays from inside the heliosphere at regular intervals though the heliospheric structure and into the interstellar medium	NAI, ENA, PLS, EPS, CRS	Penetration of heliosheath properties into the VLISM	
		How does particle acceleration occur at the termination shock and at other astrophysical shocks?	Ion and electron measurements from thermal plasma to low-energy cosmic rays on scales small compared with the shock passage time by the spacecraft	PLS, EPS, CRS - Autonomous burst mode for instruments as appropriate	Characterization of particle acceleration at the termination shock	
		Is there structure in the Zodiacal cloud due to dynamical processes associated with solar activity, planets, asteroids, comets, and Kuiper Belt objects?	Plasma and dust measurements on time scales of the solar rotation period	PLS, CDS, (PWS)	Structure and dynamics of the Zodiacal dust cloud in the outer heliosphere	
How did matter in the solar system and interstellar medium originate and evolve?	Explore the outer Solar System in search of clues to its origin, and to the nature of other planetary systems	What does the distribution of small Kuiper Belt objects and dust tell us about the formation of the solar system?	Dust and pickup ion spatial distribution and composition and composition variation with distance from the Sun	CDS, PLS, EPS, (PWS)		Properties and dynamics of bulk matter in the outer solar system and VLISM
		How does the structure of the Zodiacal dust cloud impact infrared observations of the galaxy and searches for planets around other stars?	Infrared flux from near IR to at least ten's of microns	Not measured	Quantified extinction from Zodiacal dust	
		What are the origin, nature, and distribution of organic matter in the outer solar system and the interstellar medium?	Dust composition, pickup ions from C, N, O	CDS, PLS, EPS, (PWS)	Identification of <i>in situ</i> organic materials or fragments in the heliospheric boundary regions and/or VLISM

Neber, M. S. Potgieter, G. P. Zank, and R. A. Mewaldt, A cosmic ray detector for an interstellar probe, pp. 471-474 in "The Outer H"		Clear FOV	Differential flux spectra
Neutral material	CDS	Cosmic dust sensor	1.75	5.00	0.05	Same capabilities as the student dust counter (SDC) on New Horizons	Mount within 5° of ram direction; sensor area/FOV of 30 cm x 50 cm must not be obscured		Clear FOV in ram direction	Dust particle mass and limited composition
	NAI	Neutral atom detector	2.50	4.00	1.00	Measure neutral H and O at >10 eV/nucleon incoming from interstellar medium [10 eV/nuc ~44 km/s; incoming neutrals are at ~25 km/s with respect to the	Single pixel; mount looking into ram direction; conversion-plate technology		Clear FOV in anti-Sun (ram) direction	Neutral distribution functions
	ENA	Energetic neutral atom imager	2.50	4.00	1.00	Views 0.2 to 10 keV neutral atoms, 1 pixel;	~6° x 6° FOV, mount with sensor looking perpendicular to spacecraft spin axis		1-axis scanner perpendicular to spin axis	Energetic neutral atom energy flux
Photons	LAD	Lyman-alpha detector	0.30	0.20	1.00	Single-channel/single-pixel photometer (at 121.6 nm) similar to those on Pioneer 10/11 (but without the 58.4 nm channel)	Mount perpendicular to nominal spin axis; need clear field of view (~4° x 4°); average over azimuthal scan provided by spacecraft motion		1-axis scanner perpendicular to spin axis	Lyman alpha flux
			35.16	29.40	226.05					

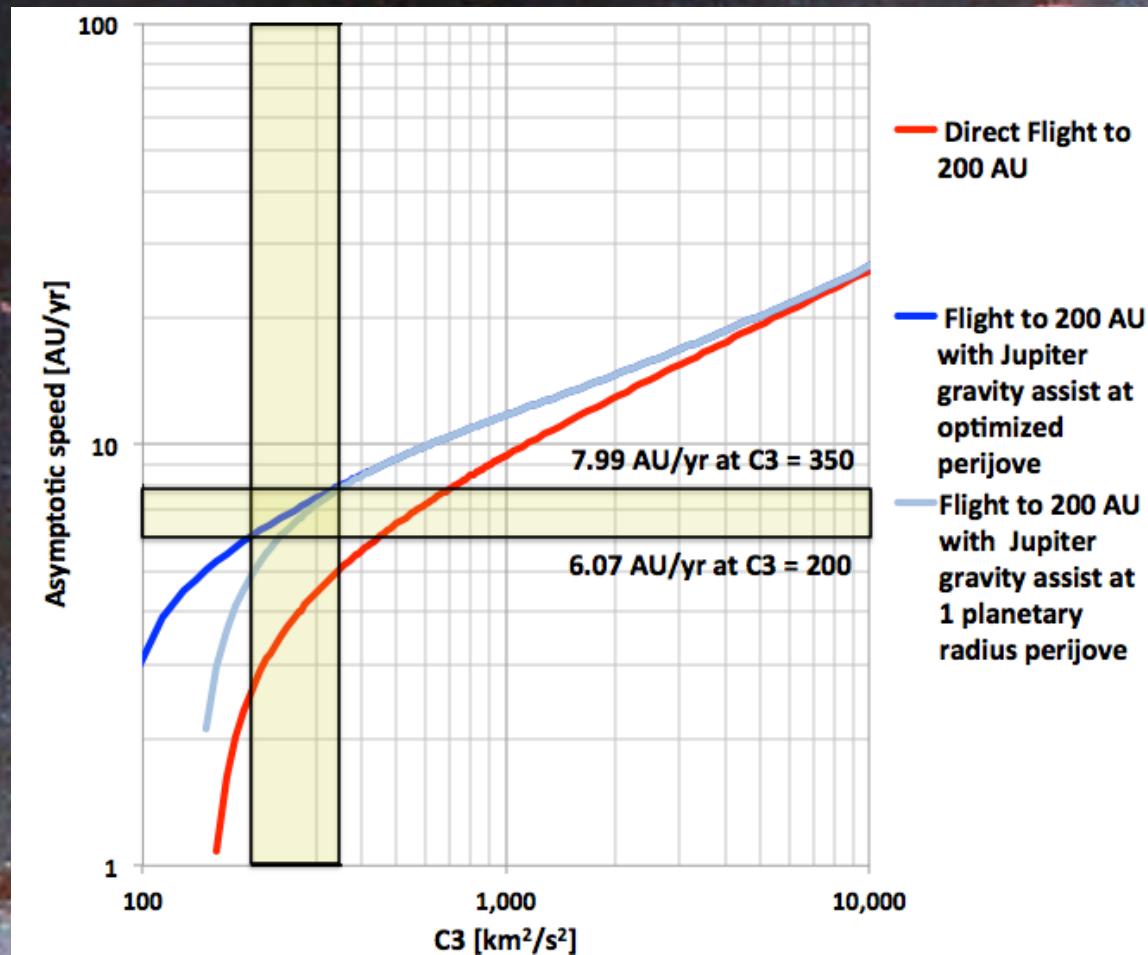

Physics Limits - Distance

- Transit times from Earth to 200 AU
 - Ballistic trajectories both with and without Jupiter gravity assists
- Optimized gravity assist cuts transit time by factor >2 for $C_3 < 350 \text{ km}^2/\text{s}^2$
- Voyager 1
 - 129.5 AU (18 light hours)
 - 37 years en route
 - $C_3 \sim 100 \text{ km}^2/\text{s}^2$
 - Jupiter and Saturn assists

Physics Limits - Speed

- Voyager 1 is the fastest object leaving the solar system
 - Speed is 3.6 AU per year (17 km/s)
- Twice that speed is 7.2 AU/yr (34 km/s)
 - Achieved for a launch C3 of 278 km^2/s^2

Interstellar Probe

Notional model of an Interstellar Probe. Notable features include the high-gain antenna (HGA) for communications, radioisotope power supplies (RPS) for electrical power, boom for the magnetometer (lower left) and antennas for plasma wave detection

Large NEP Systems?

- Thousand AU Mission (TAU) (Nock, 1987)
- Nuclear Electric to 1000 AU
 - 1 MWe
 - 12.5 kg/kW specific mass
- 60 mt launch mass
- 10 mt dry mass
- 40 MT Xe
- 1000 AU in 50 years

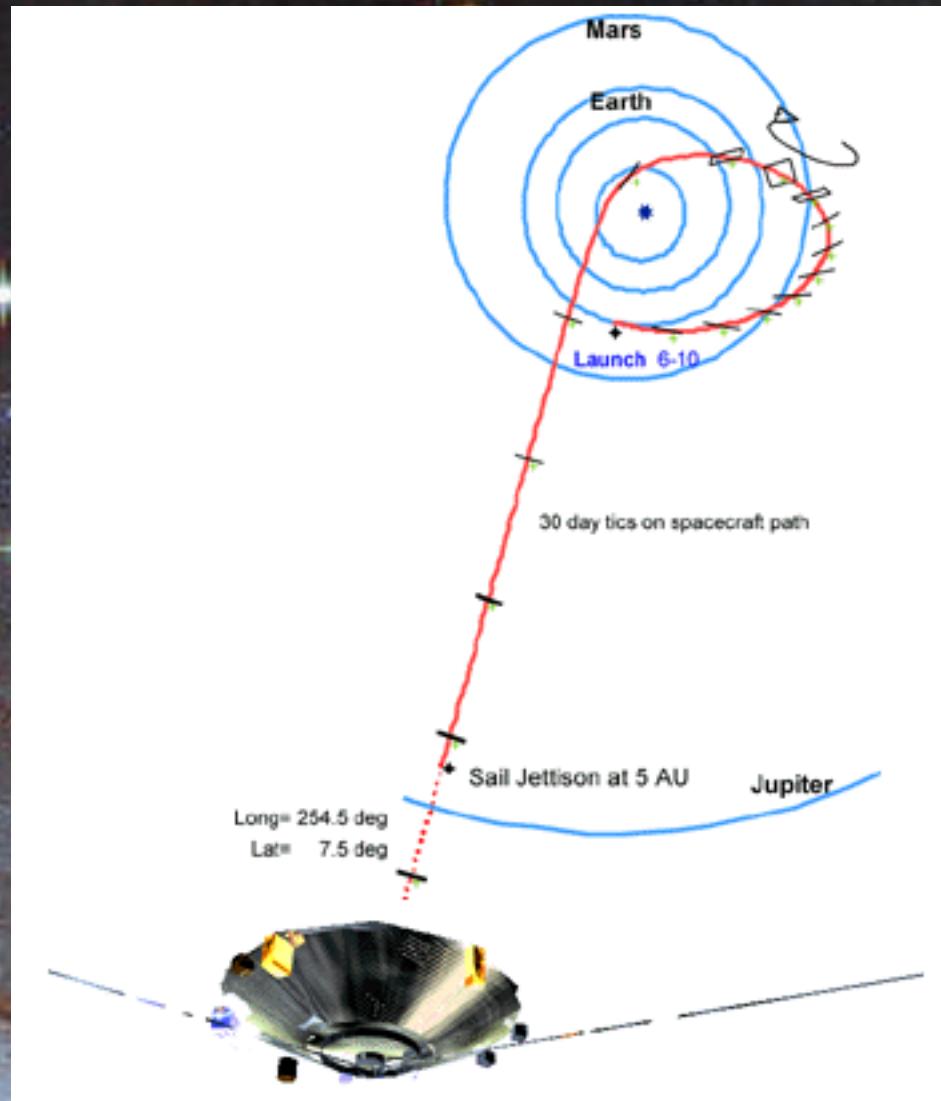

Or back to small?

- NASA Interstellar Probe Science and Technology Definition Team (IPSTDT) stood up in 1999 to relook at the precursor “problem”

A small spacecraft using a solar sail for propulsion and a near Sun encounter was baselined

To 200 AU in 15 years
Payload requirements similar to those of Pioneer 10

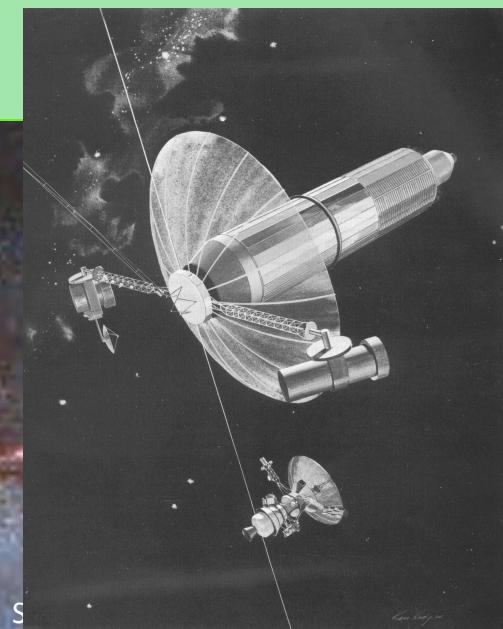

All in-space propulsion approaches to an Interstellar Probe

Mission Need Propulsion Development

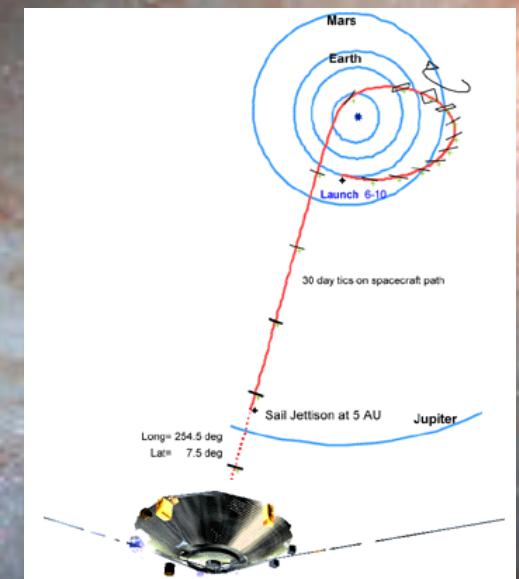

- Ballistic (NIAC 2004)
 - optimized launch 20 Feb 2019
 - Jupiter flyby 19 June 2020
 - Perihelion maneuver 4 Nov 2021 at 4 RS
 - 1000 AU 17 Oct 2071
 - 12.16 kg science
 - 1.1 MT
- Nuclear Electric (JPL 1980)
 - 2015 departure 20 years to 200 AU
 - 30 kg science package
 - Bimodal nuclear propulsion
 - 11.4 MT
- Solar Sail (NASA 1999)
 - 200 AU in 15 years
 - Perihelion at 0.25 AU
 - Jettison 400m dia sail at ~5 AU
 - 25 kg science
 - 246 kg

Launch Vehicles

Launch Vehicle Lift Capabilities

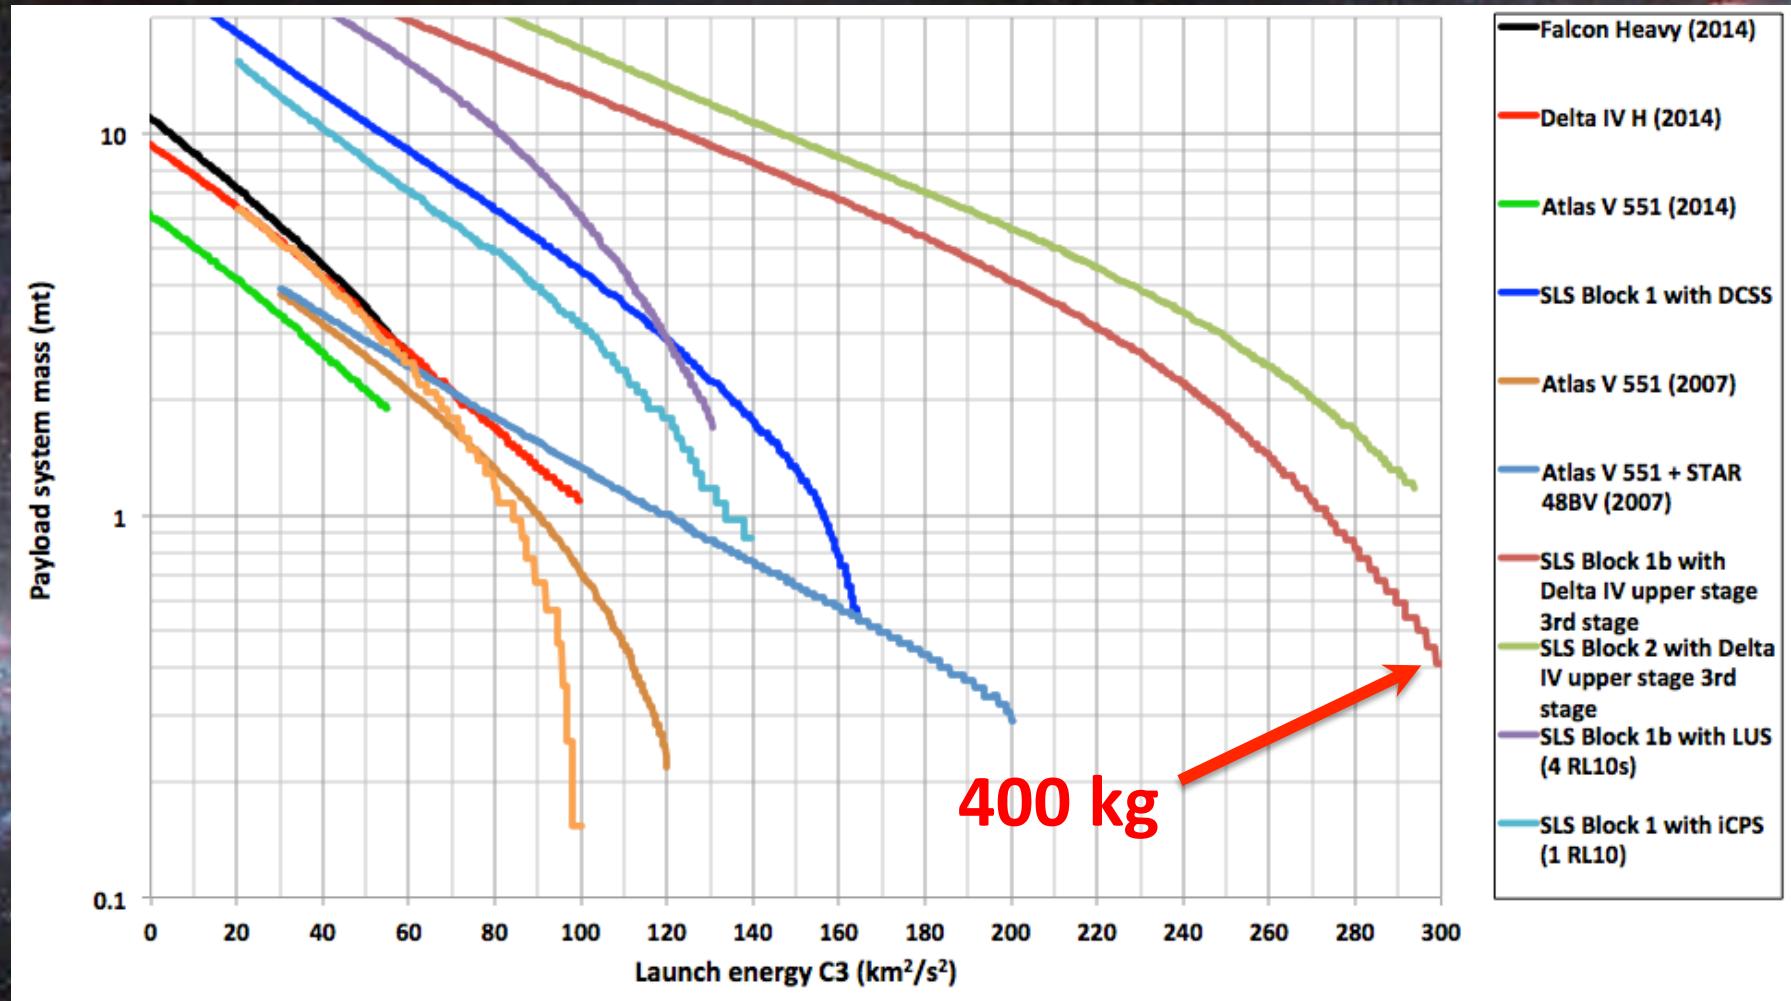

Comparison of current and notional launch vehicle capabilities for some of the vehicles usable for high-C3 and/or heavy – lift, robotic space missions

The SLS Block 1B Could be Enabling

- Four notional approaches:
 - 1) High C3 launch
 - 2) Add Jupiter gravity assist
 - 3) Add powered Jupiter gravity assist
 - 4) Use Jupiter (and other gravity assists) to enable Obert maneuver close to the Sun
- **Increasing difficulty couples to increasing performance**

Performance of various large launch vehicles to large launch energies

Reference Mission Goals

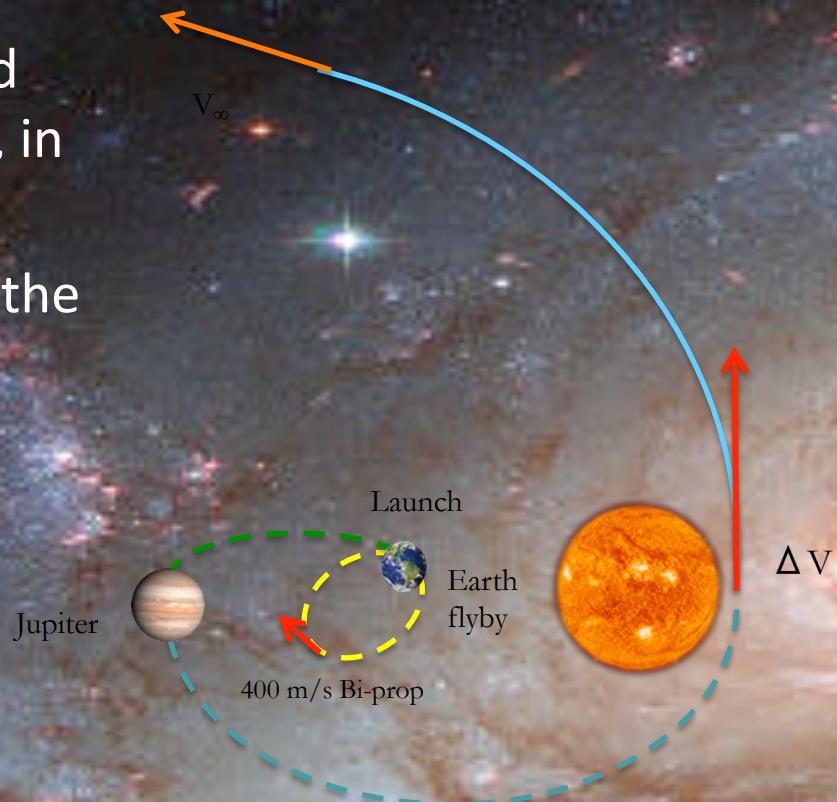

Send a spacecraft to the interstellar medium, capable of:

1. Reaching ~200 AU in ~20 years from launch
2. Travelling at high solar system escape velocity (13 AU / Yr.)
 - > 500 AU in 50 years (option 4)
 - Voyager 1 ~ 3.5 AU/Yr., New Horizons ~2.5 AU/Yr.
3. Survivability
 - Design for 20 years; good to last for 50 years
4. Cost ~ \$ 1 Billion or less (Team-X cost estimates)
 - Excluding launch vehicle and phase E cost
5. Fit on an SLS Block 1B

Mission Design Overview

- A reference mission was designed between the two KISS workshops, in conjunction with Team-X (JPL)
- KBO flyby was not considered for the Team-X design. Simpler problem.

Options	Launch energy (C3, km ² /s ²)	Launch mass (Metric Ton)
E-J-Sun-Escape	116	7.3
E-ΔV-E-J-Sun-Escape	47.3	16.8

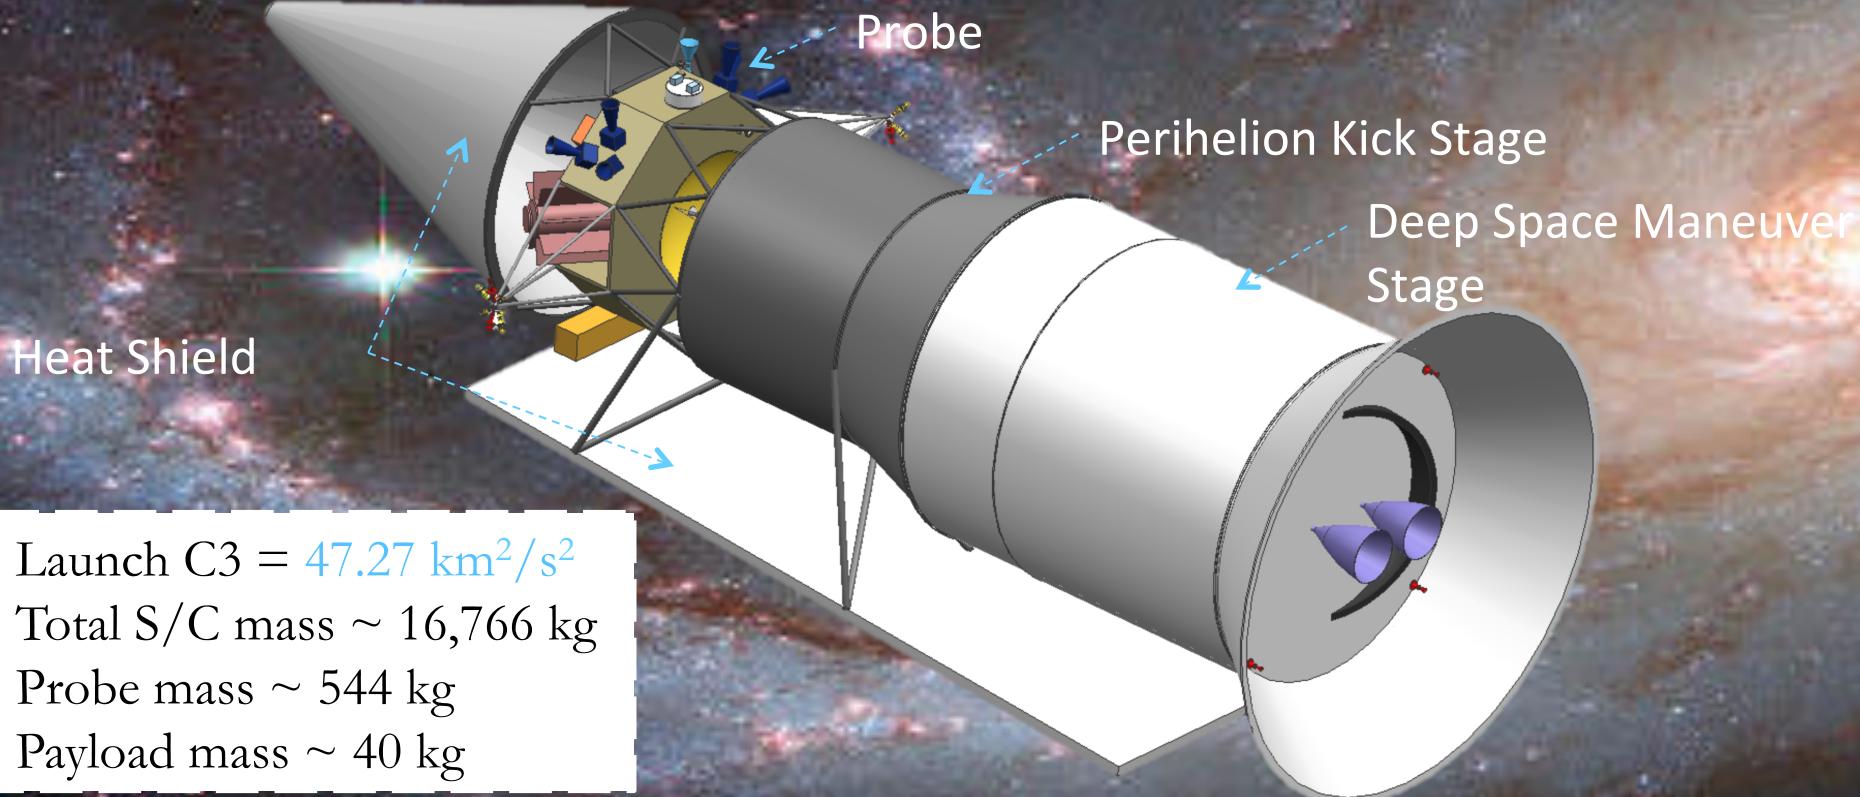

Enabling Features:

- Perihelion burn provides breakthrough escape velocity of > 13 AU/Yr.
- Low launch C3 ‘banks’ delta-V for use at perihelion
- Launch on a near term SLS-1B

Spacecraft Overview

One probe with a single solid rocket motor “Perihelion Kick Stage” and another bi-propellant “Deep Space Maneuver” stage for ~500m/s of Delta-V prior to the perihelion burn.

Flight System Elements

Three Stages

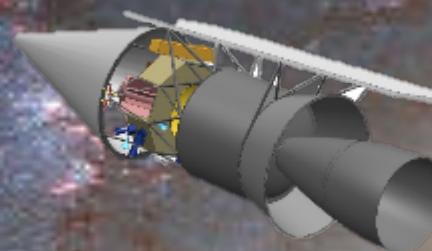

1. ISM Probe

- Spinner
- Big ACS (22N and 0.9N thrusters)
- ~500 KG

2. Perihelion Kick Stage

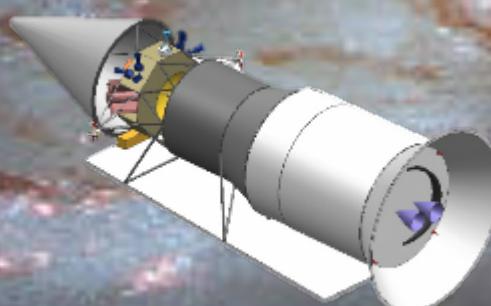

- 3 axis stabilized
- Heat shield
- Truss and support structure
- SRM (deployed)

3. Deep Space Maneuver stage

- 3 axis stabilized
- Bi-Prop system
- Load bearing structure

(one of the mass and cost drivers)

Mission Design Overview

1.a Launch $v_\infty = 6.875$ km/sec

1.b Launch Date = Feb-19-2027

2.a DSM date = Dec-27-2028

2.b DSM $\Delta V = \sim 0.4$ km/sec

2.c Post DSM Earth Flyby date = Jan-12-2030

3.a Jupiter Arrival date = July-15-2031

3.b Jupiter Flyby alt. (km) = 621781

3.c Jupiter Flyby v_∞ (km/s) = 12.01

4.a Drop Bi-prop stage and associated mass

4.b Drop off distance = before perihelion

5.a Solar Encounter date = June-22-2033

5.b Perihelion distance = 2.8 solar radii

5.c SRM ΔV (km/s) = ~ 5.55

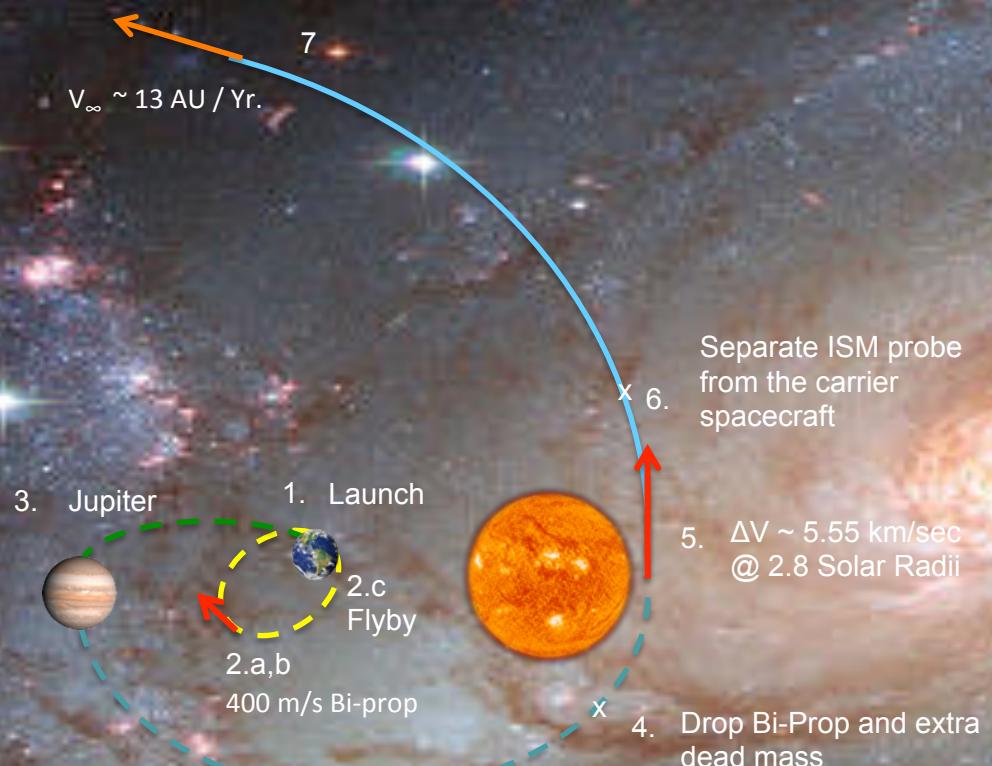

5.d Time from launch to perihelion = ~ 6.34 yrs.

6.a Distance from Sun = 1 AU

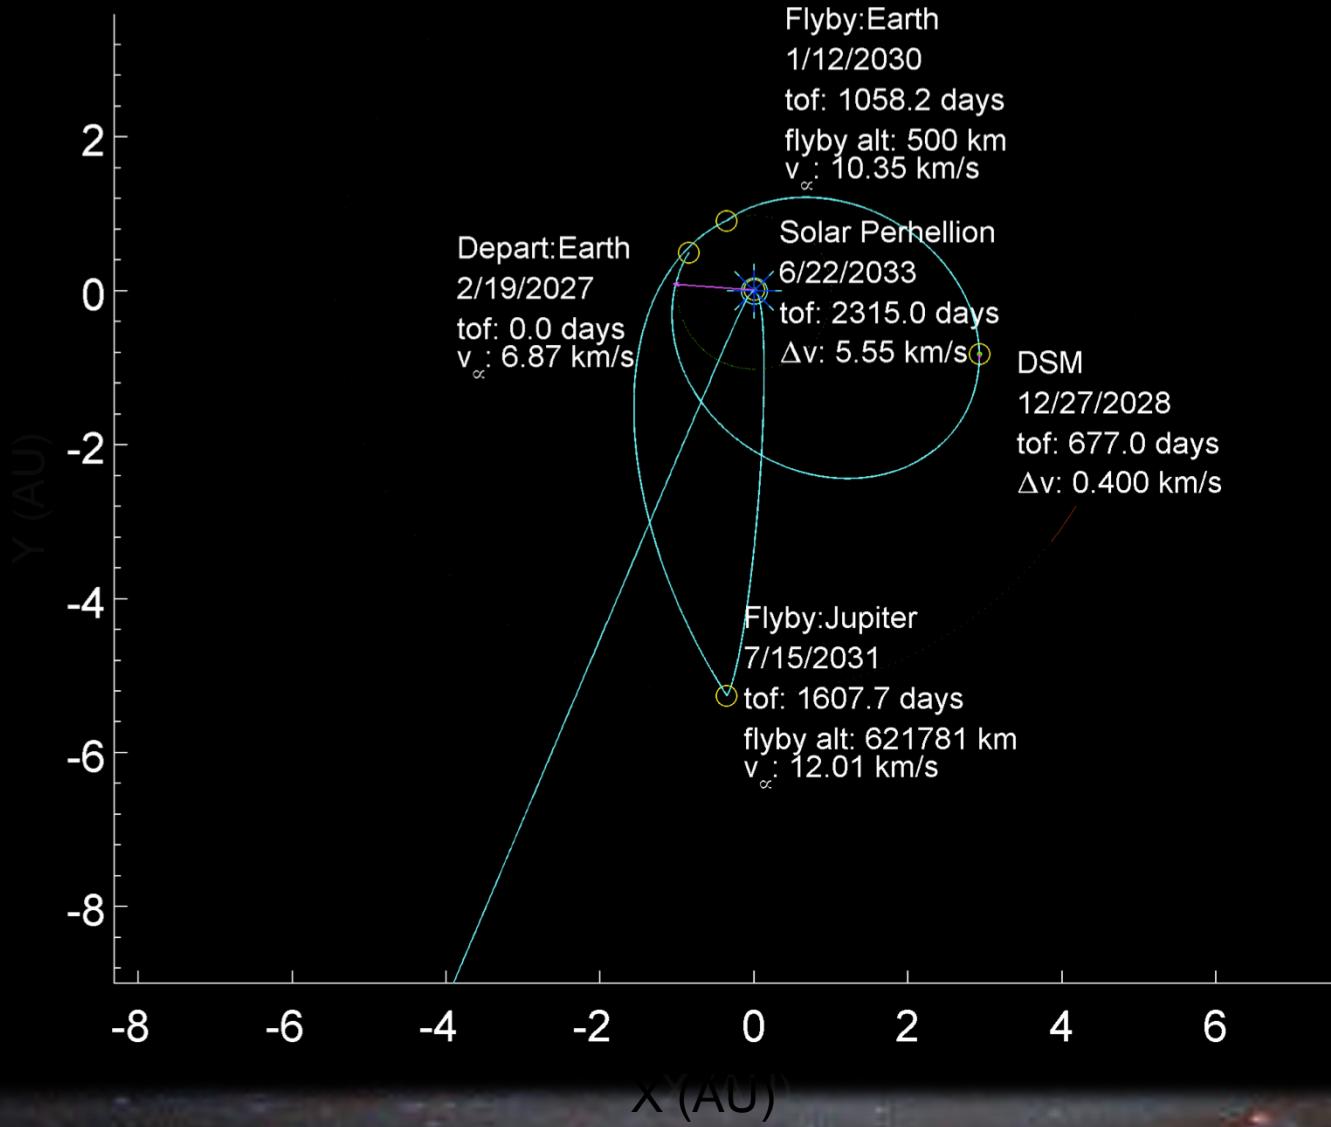

6.b Separate ISM probe

7.a Solar system escape $v_\infty = \sim 13$ AU/Yr. (~ 62 km/s)

7.b Time to 200 AU = ~ 21.5 Years

Solar Perihelion Rocket Motor

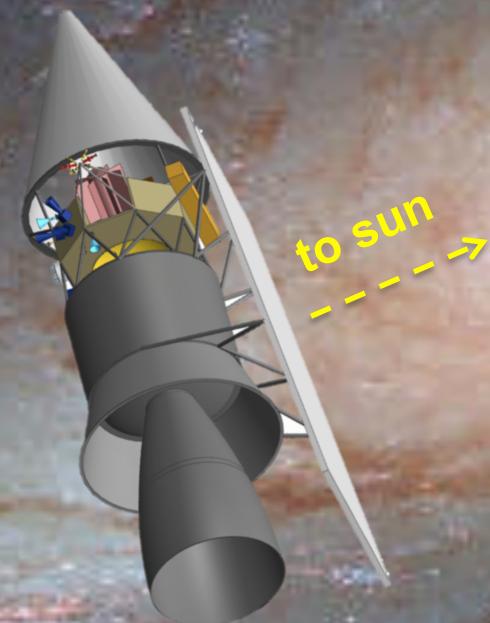

- **STAR 75 with Graphite case**
- ~10 Tons of fuel
- 315 ISP
- Vector Nozzle

Concept for deployable gas nozzle extension

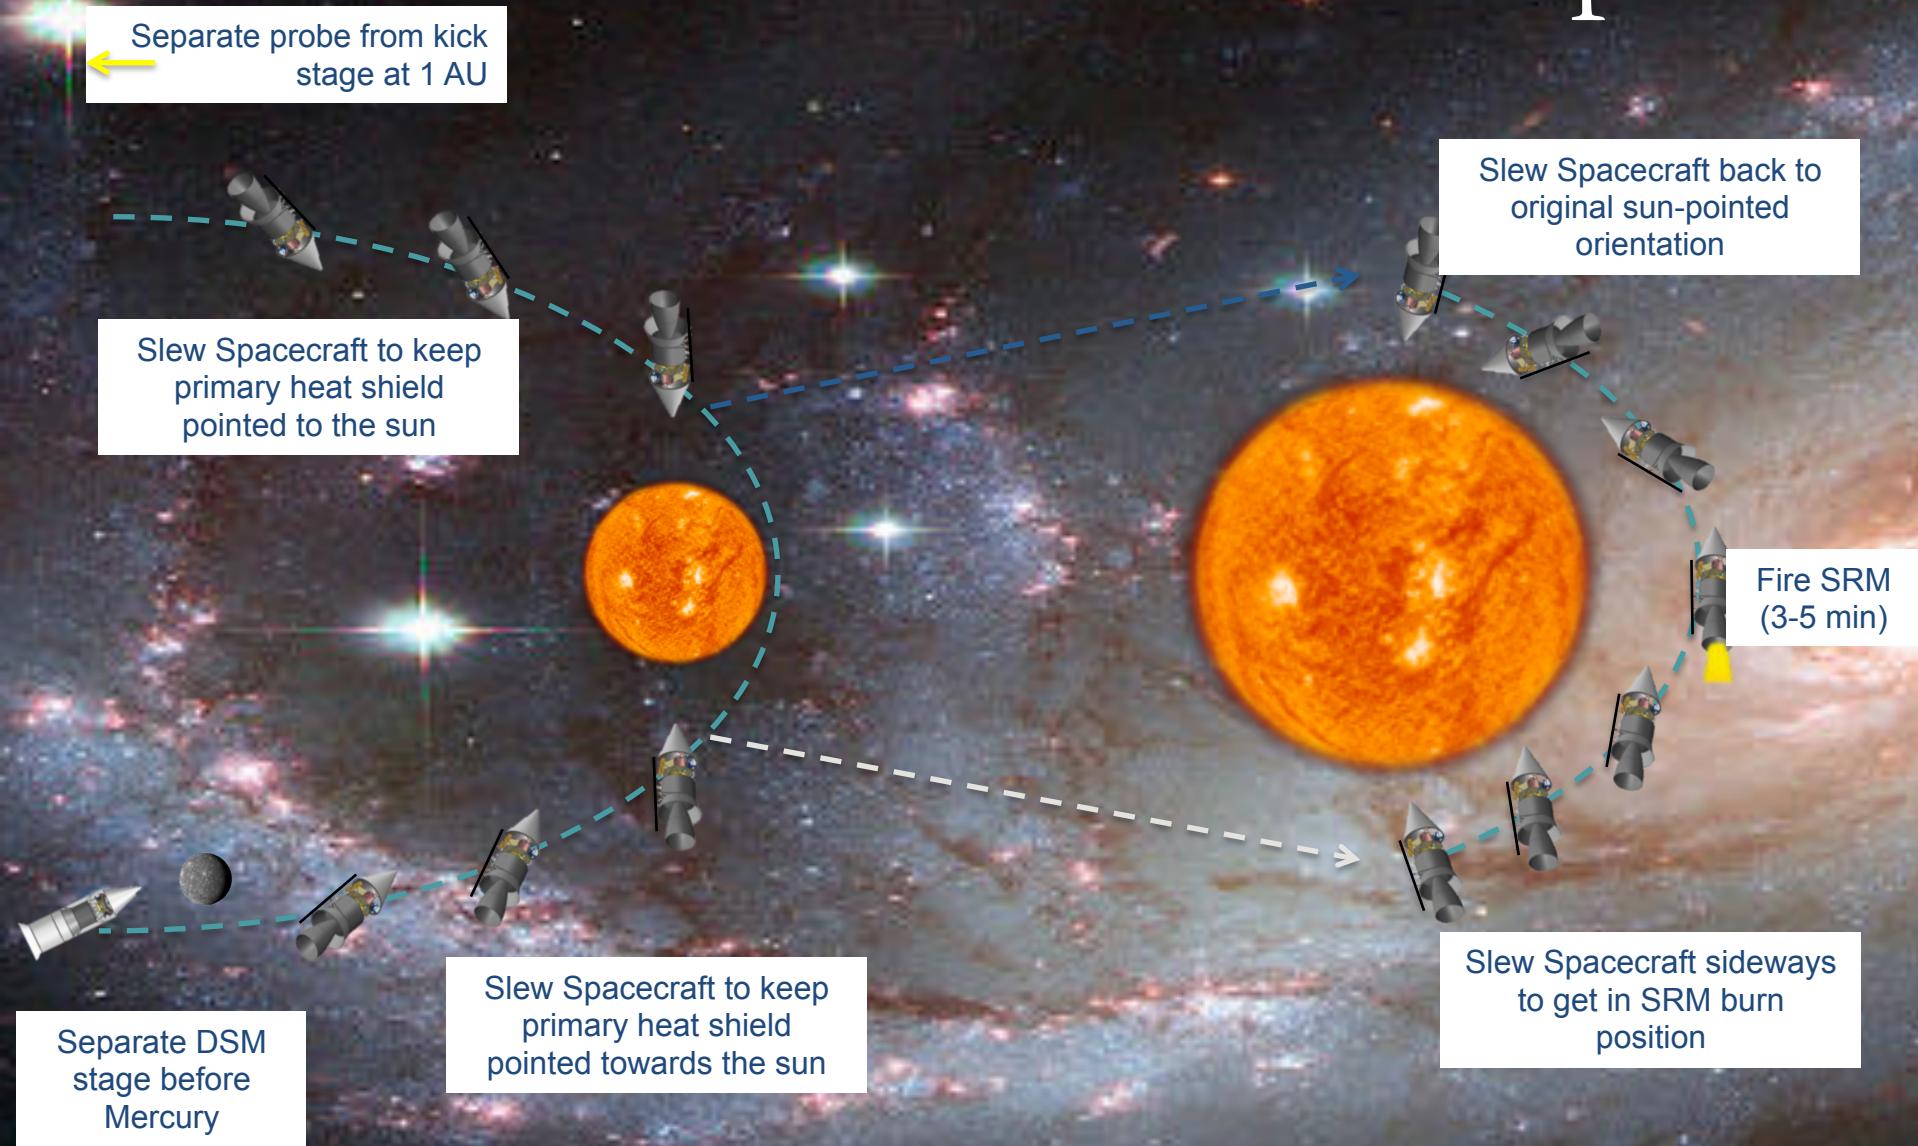

Heat Shield Design Overview

- Slew to make S/C face the Sun as it approaches perihelion
 - Use conical heat shield to protect (like JPL Solar Probe)
 - Slew to face the sun as we approach perihelion
 - CBE Mass, primary conical shield = 183 kg
- Slew side ways close to the perihelion burn, fire the SRM and then slew back to the Sun facing mode
 - Need ~ 25-30 mins for the whole event
 - Assume 5 mins burn time (conservative)
 - 25 mins to slew in and slew out
 - ~0.11 deg/sec
 - Design for 0.15 deg/sec
 - Use secondary flat plate heat shield
 - Conservative design
 - CBE Mass, secondary flat plate = 107 kg
- Single, better heat shield design possible (future work)
- Added Material, Environmental etc. Contingency = 30 %

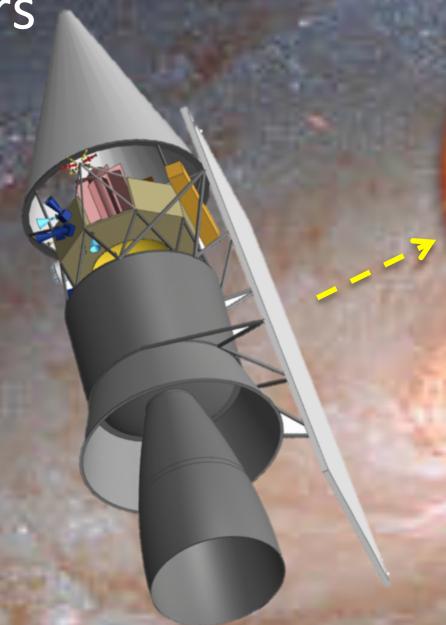

Solar Encounter Con-Ops

Enabling Technologies for Mission

- Thermal protection system for low solar perihelion burn
- Vector + extended nozzle Star or hybrid motors
- Multi use Optical Instrument:
 1. Optical Science instrument:
 - KBO Imager at high velocities
 - Zodiacal background science instrument
 2. Optical navigation and communication terminal
- Advanced RTG power source
 - eMMRTG already under development
 - ARTG will be better
- Low power spacecraft systems and operations
- Miniaturized instruments, deployable systems (telecom), autonomy & quick hibernation

High C3 Possibilities

Notional: SLS Block 1b Exploration Upper Stage with an Orion capsule following separation from the booster

Enablers for ANY Architecture

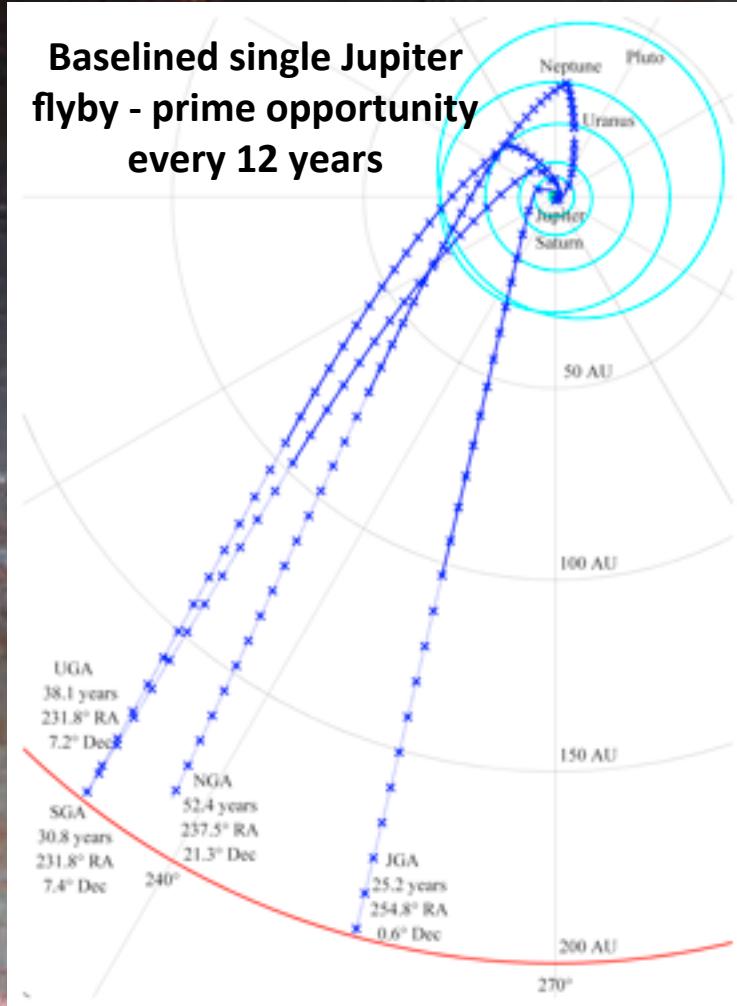

- “Affordable” launch vehicle including high-energy stage
- kWe power supply with low specific mass
 - Pu-238 is REQUIRED
- Reliable and sensitive deep, space communications at Ka-band
- Mission operations and data analysis (MO&DA)
 - \$10 M per year for 30 years at 3% per annum inflation ~\$500M

“Vision Mission” REP Mission Design Options

- Various upper stage options for Delta IV H were studied
- Investigated 12 existing and conceptual upper stages
- Final system was too heavy for Star 48 + Star 37 upper “stage”
- Went to a Star 48A “double stack” with custom interfaces

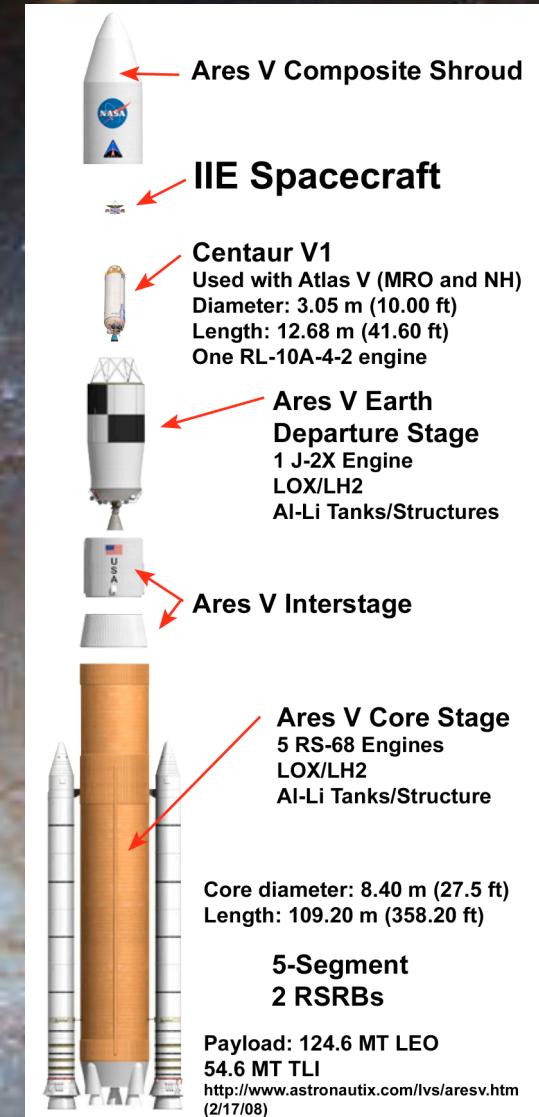

Baselined single Jupiter flyby - prime opportunity every 12 years

Assembling the Pieces

- Figure is to approximate scale
- Earth Departure Stage is only partially fueled to optimize launch energy
- First iteration: $C_3 \sim 270 \text{ km}^2/\text{s}^2$
 - Corresponding asymptotic speed from the solar system is $\sim 19.0 \text{ km/s} \sim 4 \text{ AU/yr}$
 - New Horizons
 - Launched to $164 \text{ km}^2/\text{s}^2$
 - Pluto flyby at $13.8 \text{ km/s} = 2.9 \text{ AU/yr}$
 - Voyager 1 current speed = 3.6 AU/yr
 - Voyager 2 current speed = 3.3 AU/yr
- To reach 9.5 AU/yr (45 km/s) with only a launch from Earth would require $C_3 = 1,016 \text{ km}^2/\text{s}^2$
- Even with an Ares V, launch remains only one component

Earth orbital speed = 29.79 km/s ; $1 \text{ AU/yr} = 4.74 \text{ km/s}$

Nuclear Upper Stage ?

- Nuclear stage advantages

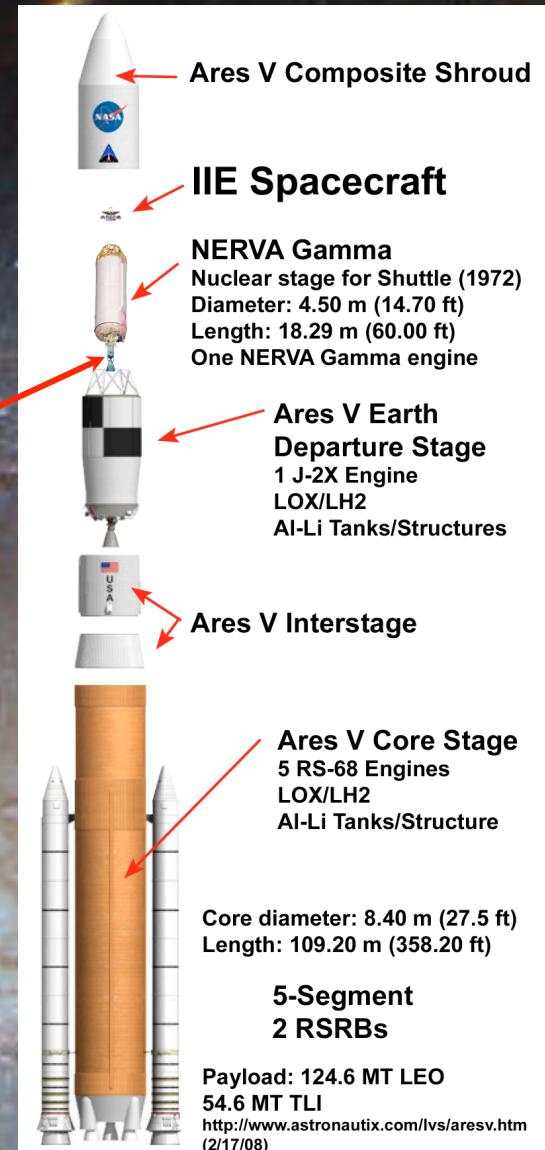

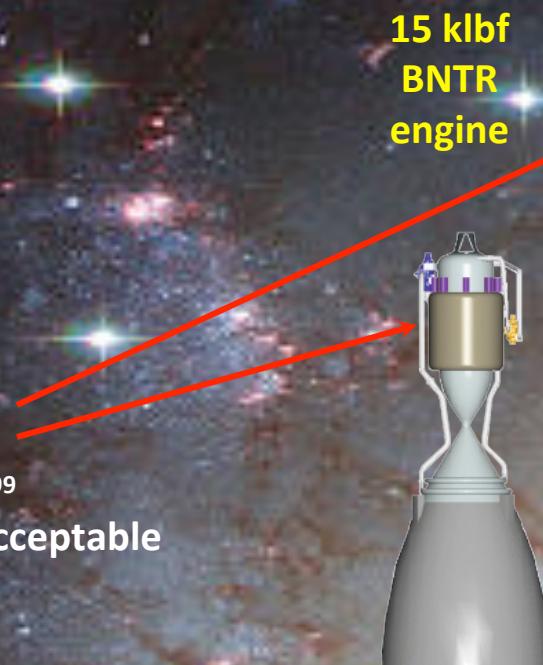

- More performance than Centaur V1
- Lower mass
- Earth escape trajectory
- Fully flight qualified

- Nuclear stage disadvantages

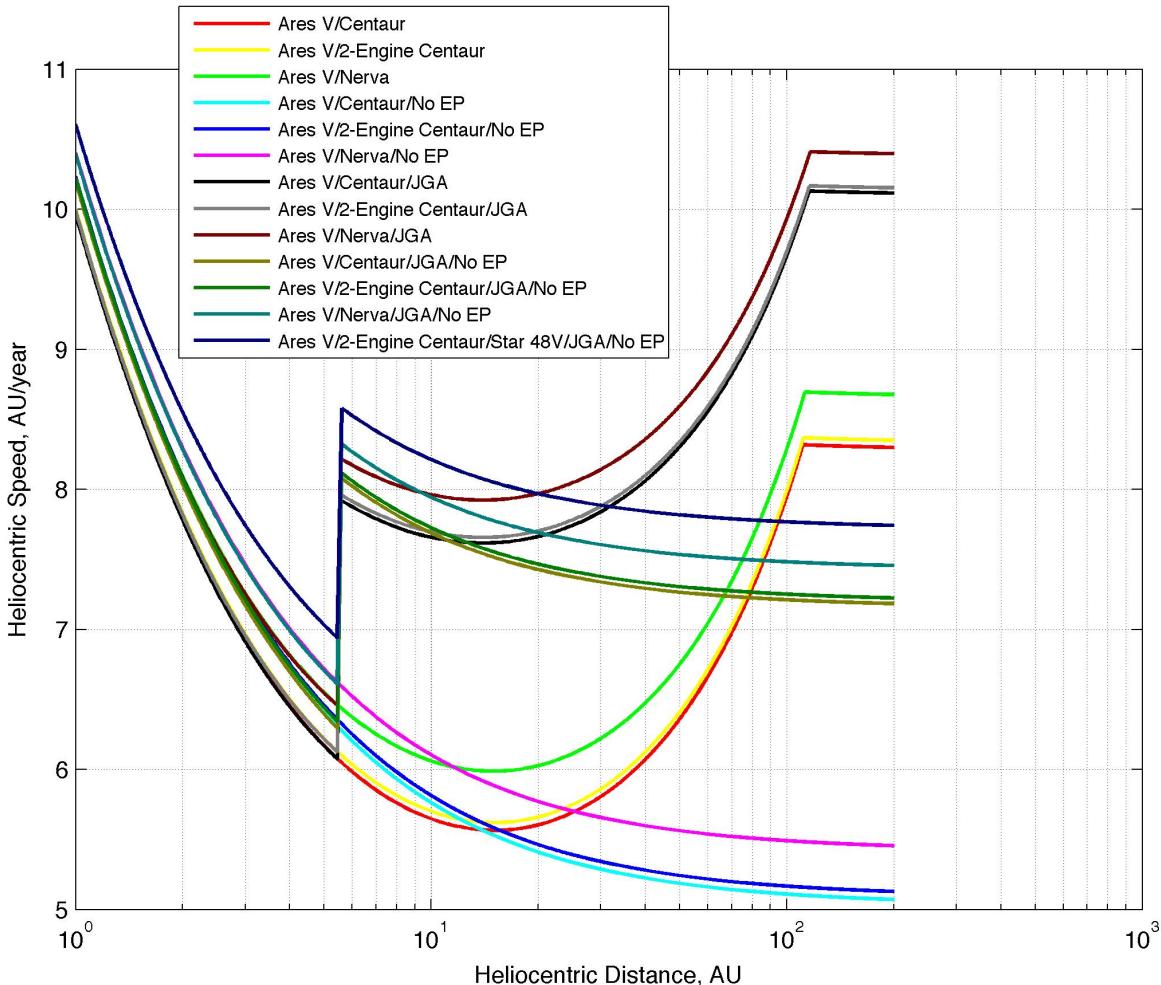

- More expensive than Centaur
- Larger (low LH₂ volume)
- Not solar system escape trajectory
- Requires development
 - Gamma engine thrust 81 kN (18,209 lbf)
 - BNTR engine thrust 66.7 kN (15,000 lbf)
 - 3 BNTR's baselined for Mars DRM 4.0 of 1999

- Nuclear Earth Departure Stage not acceptable

- Not Earth-escape trajectory
- Comparable thrust engine to NERVA 2
 - 867.4 kN (195 klbf)
 - Stage mass: 178,321 kg wet, 34,019 kg dry
 - Compare S IVB: 119,900 kg wet, 13,300 kg dry; J-2: 486.2 kN (109.3 lbf)
- No development plans or identified requirements

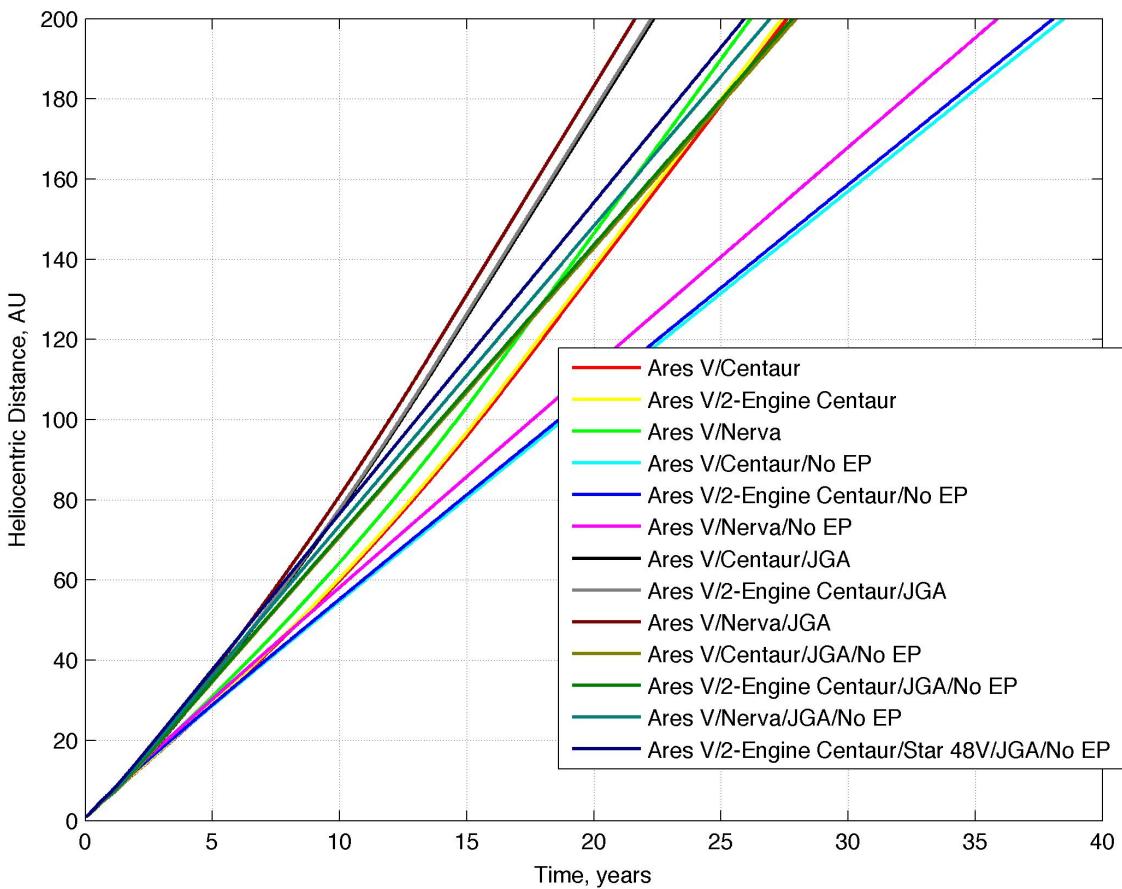

Comparing the Options: Speed to 200 AU and Beyond

- Probe speed versus heliocentric distance
 - To 200 AU
 - Log distance
 - JGA is the discontinuity

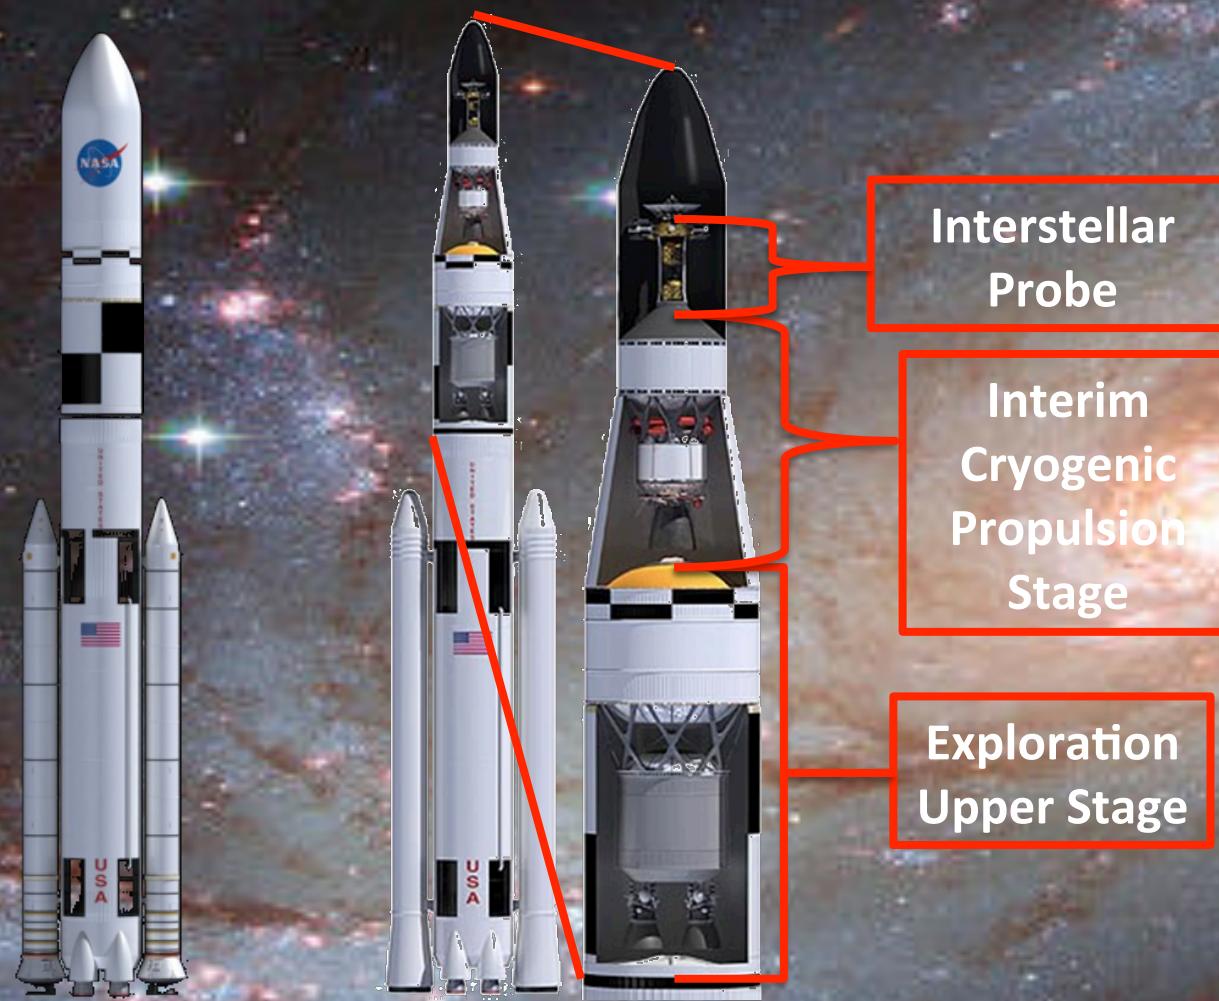

Comparing the Options: Time to 200 AU

- Spread among options is ~22 to 38 years to 200 AU
- Widens in going to even larger distances
- Initial goal had been 15 years to 200 AU

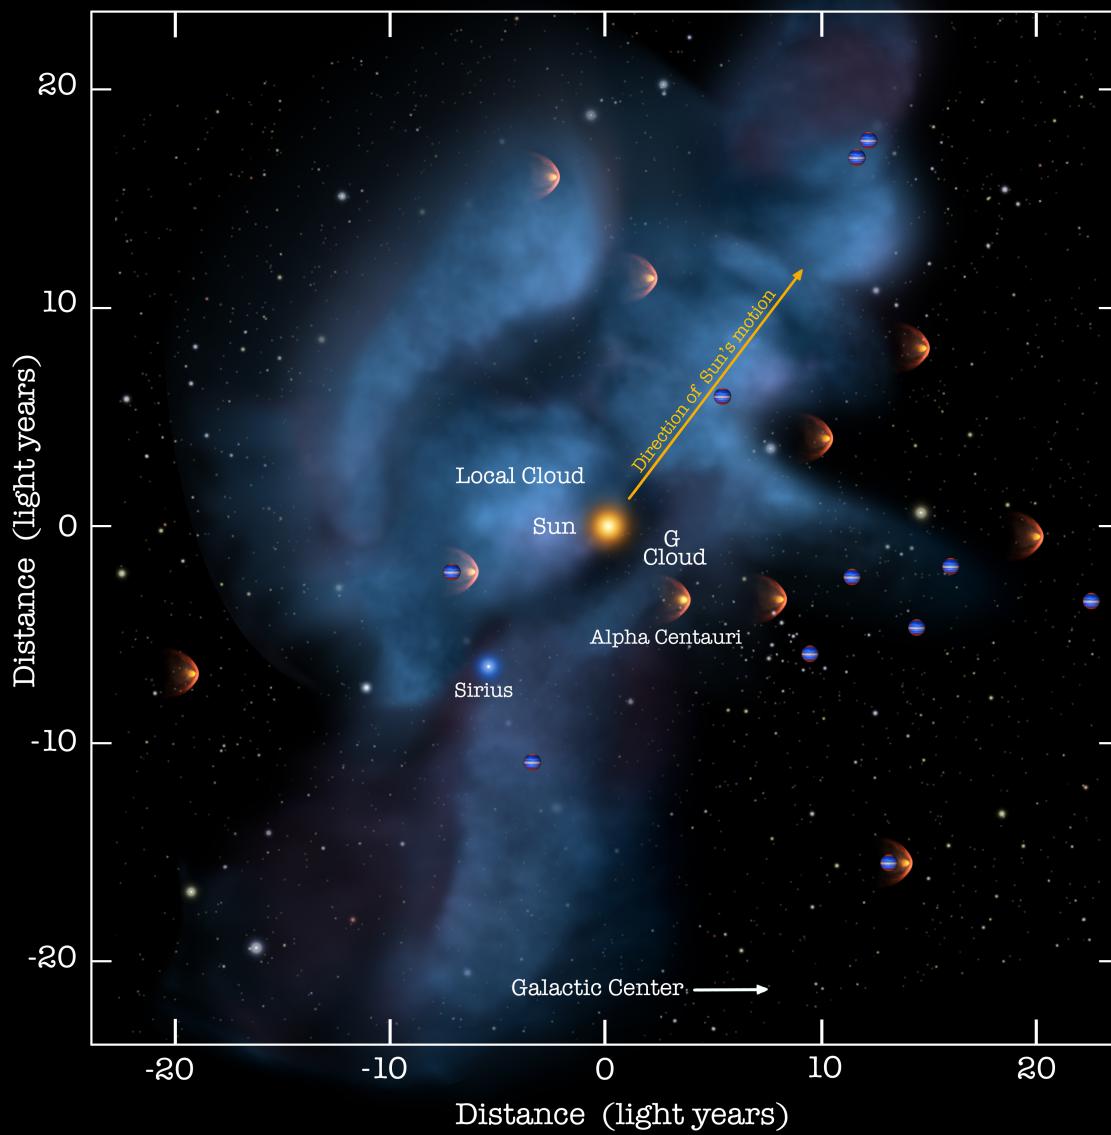

An SLS Solution

- Notional versions of the SLS
- The cargo version of SLS Block 1b is to the left
- An “evolved” version with an additional stage is shown in the center with the upper section expanded to the right

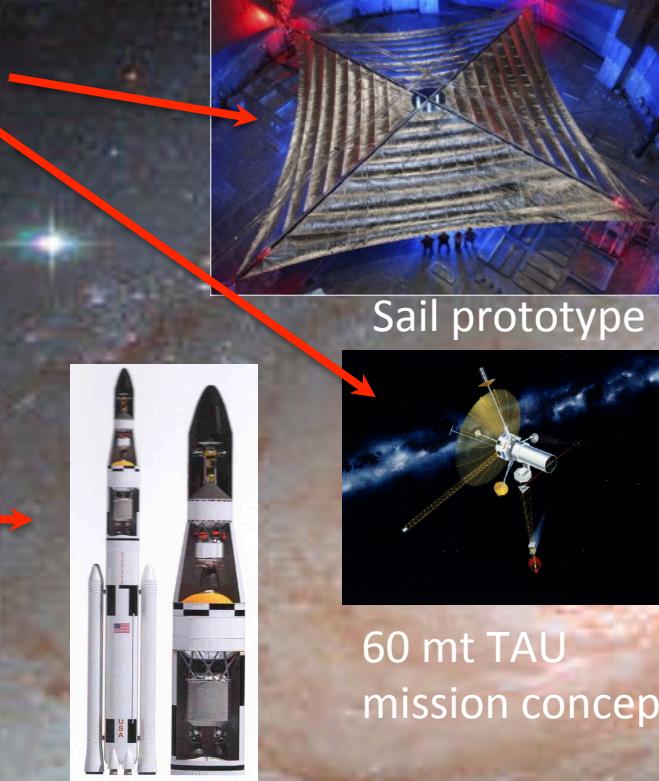

Our Heliosphere is the Key to

“The Bigger Picture”

Interstellar Probe Is a High Scientific Priority

- Development of sufficiently large Solar Sails and use of Nuclear Electric Propulsion (NEP) remain problematic
- Radioisotope electric propulsion (REP) offers advantages but also complications
- A ballistic solution is enabled by SLS with upper stages – a solid scientific use of this capability
- Optimal windows open every 12 years (Jupiter revolution about the Sun) to fly to through the heliospheric nose: 2014, 2026, 2038
- 2026 is a technically implementable launch date
- We can do this!

千里之行，始於足下
A journey of a thousand miles begins with a single step
– Lao-Tzu

It is just a question of how and when...
